Chart 2.1 Characteristics of the principle of penetration

… …

B) Line of the ball and opponent's goal line.
 • Reduce the distance between the player in 'possession of the ball and the opponent's goal or goal line;
 • Unbalance opponent's defensive organization;
 • Directly attack the opponent or the goal;
 • Create advantageous attacking situations in numerical and spatial ' 'terms.

… …

Player in possession of the ball.
 • **Carrying the ball through the available space (with or without defenders ' 'ahead).**
 • **Performing dribbles in search of numerical advantage in attacking situations or that enable the sequence ' 'of the play towards the opponent's goal line or goal.**
 • **Carrying the ball towards the opponent's goal line or goal.**
 • **Performing dribbles towards the opponent's goal line or goal searching for favourable conditions for a pass/assistance to a teammate to resume the play.**

Instantiated Knowledge: K_I

"analyze": "The current observation shows that the active player is a forward (player_1) from the Left team, who has possession of the ball in zone (11, 7). The ball is ... ... e defender (player_16) directly in front of him in zone (15, 7). **Given this setup and the provided code-based knowledge, the optimal decision for the forward would be to either dribble or pass to a teammate in a better position. Player_2 (another forward) is in zone (12, 7), which could be a good option for a short pass. Additionally, player_10 (forward) is in zone (11, 9), which might also be a viable passing option.**'],
